

BIKE WITH JET POWER DOES FORTY.

Jet propulsion, all the fashion nowadays, has spread to cycling. In Daytona, Ohio, 3 men knocked up a home made jet engine and took the push out of push-biking. Over the back wheel they fit their 3 small jets; nothing much to look at but actually a power unit of two horse power. The fuel goes into a small tank under the saddle. The inventors say nearly every bike will have jets before long. Starting in any weather merely calls for the tyre pump and a spark coil. But what about anybody driving behind? Well, even a handkerchief held close up was undamaged, so though there's a draught there's no danger. And on the highway the jet gives 40 miles an hour. Marvellous, if only those wretched ordinary cyclists don't sprawl all over the road.
