

Just a tiny, shaggy Dog, highly intelligent, and well-trained;  
 whether you call it "Curly", <sup>LAIKA, or</sup> "Little Lemon" ~~what you will.~~ the earth's first  
 "satellite"-traveller" is leading man's scientific advance into outer  
 space.

The training of space dogs (as shown by these Soviet films) reveals  
 the incredible thoroughness behind the Russian conquest of space.  
 The dogs are sealed in an air-conditioned, pressurised cabin.  
 This "Flying Kennel" (equipped with oxygen apparatus) is then placed  
 in the rocket for its journey through the earth's atmosphere.  
 Already, Soviet sources claim that these dogs have been up 130 miles,  
 and ~~some of them~~ have returned to earth.

Here's the rocket making its ascent. The first pictures of the  
 actual ~~launching~~ launching of a Soviet missile.  
~~On the way to be~~ Inside the rocket, the dog's reactions are filmed by  
 an automatic camera. According to reports, this film was taken  
 sixty-five miles ~~up~~ up.

Can it be that the Russians ~~have~~ have overcome the difficulty of  
 filming in what must surely be a dark interior?  
 The journey back is the most difficult part of all. Yet, by a strange  
 coincidence, the cameraman is on the spot as the parachute spreads  
 neatly before him. There, he awaits the happy ending.  
 The Space Traveller returns. ~~On the way to be~~
