Flash. Here is an experiment to show you how fire spreads. The paper is ignited by the draught of hot air and gasses created by the flame at the base of the lamp glass. Applied to everyday life a cigarette end thrown away carelessly in the basement or on the ground floor. Soon a fire is started, ~~a xaxslix~~ a welled staircase provides the draught that draws the heat up and causes the top story to ignite and the fire may get a good hold before it's discovered and valuable time and materials are lost. You can't be to careful. Flash. After a year's work and preparatxion the wheat is now safely reaped, it will soon be milled and put into food for you, or rather would be if it wasn't for that match. This fire means the loss of somebody's bread. You can't be to careful. A single tree contains enough timber to make millions and millions of matches, every potential one is a source of danger so when you strike one remember. You can't be to careful.
