WORLD'S BIGGEST PLANE

Size-conscious America's newest product is the "Marshall Mars", the world's biggest aircraft. 120 feet long, with a wing span of 200 feet, Mars starts a trans-Pacific mail and cargo service. You can even go upstairs to bed in this overgrown, hotel-on-wings, and the engineer has a nice little line in pants to keep him busy.

The first Mars plane crashed on its trials, but this time there are no slip-ups as the giant sea bird takes off. Carrying 13,000 gallons of petrol in addition to a huge pay load, four engines pack the power to lift the colossal flying ship in a perfect take-off.
