HAWAII

CAMERA PROBES SEA-DEPTHS

On one of the Hawaiian Islands, cameramen get ready to explore some of the dimmer corners of Davy Jones' locker.

A new device, called the Aqua Lung, which will enable them to keep below for long periods is strapped onto their backs. Now their small craft heads towards the sea.

Over the side go the explorers. With them goes a camera to record their adventure on the sea-bed.

A giant eel has been spotted, and a diver with a spear begins a new kind of underwater hunt.

Up from the depths comes the expedition's prize catch.

AQUA LUNG

DONALDSON -- Aarseth

2-281201

X Dim corners in Davy Jones locker are opened to exploration, fishing and spectacular underwater photography by a remarkable new device -- the aqua lung. In the shadow of a weather-beaten old sailing ship, on one of the Hawaiian Islands, a trio of underwater enthusiasts sets out to test the mechanical marvel.

X Dropping into the deep tropical waters off the Oahu coast, a cameraman is ready to record on film some of the wonders of the underseas world. The aqua lung will feed him his air.

X Coiled under a ledge, a huge eel is spotted and speared by one of his companions -- a thrill caught by the camera. The aqua lung permits divers to reach incredible depths and remain underwater for hours.

X Up from the bottom comes the expedition's prize catch.
