

ARMY OF TODAY'S O.K.

The Army lifts the veil of secrecy on a complete new range of weapons which will soon be part of its standard equipment. This is a 3.5 rocket launcher, a light but powerful weapon. Based on an American design, it's already in production over here for issue to infantry platoons. Full details of its performance are still secret.

Here's how the rocket launcher is fired.

Now for the successor to the famous Sten gun. It's the .280 Patchett machine carbine. Tests have proved that it's not liable to stoppages like the Sten, and it has come through extensive trials with flying colours.

A new anti-tank grenade which can be fired from an ordinary rifle. It's as powerful as the best infantry anti-tank gun of the last war, although the war-head weighs only 21 ounces. This brand new array of weapons make the British infantryman one of the most powerfully equipped in the world.
