

5473.

HURRICANE EDNA.

The Atlantic coast of America is battered by a tempestuous hurricane nicknamed Edna. This follows almost in the wake of Hurricane Carol, but this time the storm is more savage. Winds of more than a hundred miles an hour and pounding seas hammer at towns along the coast.

New England is in the path of Hurricane Edna. Here, record rainfalls are reported. Then comes the news that the storm is heading for New York. Winds of about 120 miles an hour are forecast to hit the city. Meanwhile Edna is transformed into a rare, double-centred hurricane as it sweeps into Maine.

As the storm continues to rage the death-roll mounts, until it is finally announced that twenty people have been killed. Power and communication lines are out, crops are ruined; damage is estimated at fifty million dollars.

Hurricane Edna suddenly switches its course and misses New York. On it goes through Eastern Canada, and finally blows itself out in the Gulf of St. Lawrence. Now the skies are clear again over America's Atlantic coast as the work of salvage begins.
