

ATOM POWER ? ON THE GRID.

In a steel sphere, twenty storeys high, America's first atomic electricity for commercial use is ready to flow along the grid to homes and factories in New York State. Atomic Energy Commission Chairman Strauss throws the switch, and the world's biggest electric lamp shows the current's on.

This atom-powered steam generator produces enough current for a city of thirty thousand people. And at the first house along the line, they're cooking with atom juice already.

Nuclear hamburgers coming up!
