

WATERCOPTER.

America's always thinking up new sports, and here's the latest - a cross between gliding and water-skiing, with a dash of helicopter thrown in. Towed by a motorboat, this water copter takes off at 25 miles an hour, and can climb to 100 feet. It's amazingly light and can be put together from a do-it-yourself kit. It's a perfectly safe, and inventor says, for if the rope breaks, it settles down even more slowly than a parachute. Best of all, you don't need a pilot's licence!
