THE FIRSTBORN OF THE ANGARA HYDRO POWER PROJECT

Lenin's words have come true.....

The country has been covered with a dense network of power stations, and new power plants are being built.

Today the Soviet Union turns out as much electrical power per day, as all the stations of the tsarist Russia produced in a year.

This is the construction site of the Irkutsk Hydro Power Plant-- the firstborn of the Angara Cascade, which will consist of eight power stations.

The Irkutsk Power Station will provide the country with more electrical power than that produced by Dnieproges.

Despite severe frost work is humming on the construction site.

Competing to mark the Twentieth Party Congress, the builders have exceeded the January quota on the construction of the dam and the assembly work.

The bright lights from electric welding are seen at a great distance through the evening haze.....

The new Irkutsk Hydro Power station will blaze forth with thousands of lights in December 1956.
