

"SCORPION" STRIKES

BARUCH -- Aarseth

A pilotless B-17 bomber is destined for destruction by deadly "air-to-air" rockets fired from a Scorpion interceptor.

A single rocket hit can destroy the biggest aircraft in the world.

A second salvo strikes.

The Scorpion, which can carry one-hundred-four rockets -- is the heaviest armed fighter in the sky. In any weather -- at altitudes up to forty-five thousand feet -- the rockets never miss their target.

The B-17's fiery descent is spectacular proof that the Scorpion can do its job -- backbone of a supersonic armada to act as an umbrella against any atomic attack.
