LEVIATHAN OF THE AIR.

Our American Cousins claim the Douglas B.19 to be the largest bomber in the world. It is undergoing final assembly before leaving the California Factory. The result of four years labour behind locked doors, this sky Leviathan will take to the air bet ween wings spreading over two hundred feet. Lifted by four two-thosand horse power engines, the plane will aim for range rather than speed. While performance figures are jealously locked in Government files, it is expected that this monster craft will be able to fly from San Francisco to Europe, and back to New York in a single hop. Nine thousand miles! That's some hop!
