SELF-CATABULTING AUTOGYRO

At Bonham Field, in the District of Columbia, a new type of autogyro is warming up for its trials. It's a self-cataapulting machine and the large horizontal airscrews are ready for an almost vertical take off. Apart from its vertical rise, the autogyro needs hardly any room for a take off. Yes, that's straight up. The machine takes less than six seconds to rise and fly normally and experts are becoming more and more impressed with its possibilities as a spotter for artillery.
