

BEAUTIFUL BOMBS FROM CANADA.

For the first time in its history, Canada is turning scrap Metal into aerial bombs. Over this metal mountain travels a magnetic crane, sending the salvage on the start of its journey.

Built less than 12 months ago, this factory is already manufacturing the deadly missiles at a colossal rate. Giant 7 ton electric steel furnaces; especially designed moulding equipment and batteries of machines, hum 24 hours a day as Canada forges the sinews of war. T.N.T. goes into the melting ovens as in the filling rooms the explosive is stirred (or puddled) into the finished casings.

Most of these lethal babies are five hundred pounds, and are just a few R.A.F. visiting cards to return some calls of the past months. We're not standing on ceremony these days, Germany is getting and will continue to get a flogging she will never forget.

So long big boy, you're on your way.
