

ENGINEERS CLEAR THE WAY.

The Army wants to go through a forest, so the Royal Engineers are given the job of clearing the way. This is where the anglezers and bulldozers come in. These hefty machines just set their noses in the direction of obstacles, and push them down, or brush them aside, like a queue crusher at a bus stop. Almost as quickly as you can now buy a packet of cigarettes, there's a nice clear road through the forest for transport and troops.

And now the army wants to cross a deep cutting with high embankments. The Engineers decide to push down part of the embankment on either side into the cutting.. and so form a bridge. The mighty machines soon alter the shape of the earth's surface to conform to military requirements. The embankments are out; the soil is pushed down, and very soon there's nothing to hold up the advance of the army.
