NEW WONDER PLANE

At Baltimore, Maryland, they're trying out a new plane and trying to prove that wings aren't always necessary for flight. I don't know what any bird might say. This one hasn't any wings but watch her graceful landing. The new machine is square built but with a new idea in streamlining which is claimed to favour use of wind resistance. Inventor Nelson Edwards, in flying kit, shows off the child of his own imagination. His dream is now realised and the new wingless wonder is ready to go into production on a large scale if it passes its test with flying colours. And there she goes winging into space without wings.
