TITLE.:- LIFE SAVING.

Picture. :- Here's a new one! He's supposed to be in distress .

His cries for help are heard -- and the new gadget is thrown

to him As the water soaks into it, it swells up, until in

a very few seconds it becomes a useful

gas-filled buoy, capable of supporting a man in the water.

Here is the contraption at close quarters Quite a handy thing to have around

if you are in danger of drowning! It works this way -- The envelope is placed into a container A

small cardboard cylinder is then filled with calcium carbide, which, as you all know, generates acetylene gas when brought into contact with water This is then closed

and inserted in the main part of the gadget Now all that is necessary is to put its cap on,

and go out and look for a drowning man!
