

13858-C

(6).

TITLE.:- AERIAL SAFETY.

Picture.:- The invention is to be tried out by means of a small--

--plane which is attached to the upper wing of a full-sized machine. XXXX If it works alright they'll try it with the real thing ! XXXX When they are up--

--to a suitable height, the pilot releases the model plane, which, at once, goes--

--into a spin. XXXX Now for the real test ! XXXX A time-fuse sets the mechanism working, and the --

--baby plane throws out a parachute which pulls the plane's cabin with it, right away from--

--the plane itself! XXXXXX Another parachute takes care of the plane, while--

--the first one lowers the cabin and its passengers gently to earth ! XXXX Better than being in a crash, eh ?

With just a little luck the plane comes down whole too ! XXXXXX (But I think I'll go by train) !
