**ON TOP OF THE WORLD - Daring workers complete
risky task high above New York's skyline.**

-U.S.A.-

Picture.:- It's a long, long way up there, but it will be further yet--

--after the erection of--

--the 125 feet mast which is going to stand on the top of it.

For years, ships of the sea have had their lighthouses,--
--and this is going to be--
--a beacon for ships of the air.

Don't forget that these men carry their life in their--
--hands, too ! Over 900 feet above street level !

Think what a slip would mean !

The mast is made of hollow steel, and has to be--
--bolted from within, so an extra small man is squeezed inside--

--to help secure the bolts. When his job is done,--

--he will edge his way down and come out of the mast several storeys--

--lower down. See that distant liner in the Harbour ?

Looked just like a child's toy in a bath--

--to the men at this great height. These fellows must--

--have nerves of steel, too ! The red light on the top--

--of this mast will probably be the highest light--

--in the world. Great work ! But a thing to steer clear of !
