

ON THE INNER CIRCLE - Strange new vehicle

demonstrated by its inventor at Weston-super-Mare.

-Somerset-

Picture:- These curious contrivances are dynaspheres -
journalistic nickname jimbo wheels. The inventor Doctor
Pervis claims--

--that they provide the cheapest form of transport in
existence. Up to now no claim has been--

--made about their beauty of shape and line. That will
probably come later.

Notice the camera illusion of backward roll with
forward movement !

The large wheel is driven by a $2\frac{1}{2}$ horse power motor
and attains a speed of 25 miles per hour.

Steering is controlled by moving a--

--weight which causes a tilt and alteration of direction.
Here is the--

--finished model for four people. Don't all shout at
once ! They are supplied strictly in rotation.
