'PLANE OF THE FUTURE ?    Inventor claims that  
strange-looking machine is years ahead of modern  
aircraft.    -Kansas.U.S.A.-

---

Picture. :- This machine looks like upsetting all our years--  
--of aviation research and--  
--practice. It has no tail and--  
--the propeller is fitted at the back of--  
--the fuselage. The new wing design, although having  
only twenty-four feet span has 250--  
--square feet lifting area. It's weird--  
--appearance has caused America to name it "The Potato  
Bug". As opposed to the usual--  
--practice, the wings are diagonal ! Quite a  
revolutionary idea !  
Nearer the principle of bird flight than any--  
--other, says Ben Brown, the inventor !
