SAFETY IN THE AIR.

Picture.:- Life-saving in the air ! A French invention !
If you fall out, you can't--

--fall down ! The cabin of the 'plane is a separate unit,--
--automatically detachable from the fuselage,--
--and attached to a large parachute. The balloon--
--is to take up the model aeroplane. The 'plane is to be
launched in mid-air, and fall as it would do if the engines--
--failed, or other accident happened. There it is,--
--ready for the experiment. The safety device will support
eight passengers.

And there goes the 'plane ! The cabin detaches itself
and the parachute holds it safely--

--suspended. A second test is as successful as the first !
A safe and easy way to float a limited company !
