STRANGE NEW AIRCRAFT.

Picture: A Russian inventor in France demonstrates an entirely new--

--idea in helicopters. The airscrews have adjustable blades. One air screw is fitted at--

--the front and the second at the back of the fuselage. Its a very clever idea and looks so strange that it strikes me as being a little comic, flipping about in midair without any visible means of support as it were. EFFECTS.

EFFECTS.

Its already achieved several successful trial flights, much to everybody's surprise. A truly--

--marvellous affair, with which bald statement my narrative concludes.
