TWENTY - TON MIRROR

TWELVE MONTHS TO COOL.

---

Picture.:-

A ladle of twenty-tons capacity is dipped into a cauldron of molten glass, and, of course, comes out full. The glass is carried through the Laboratories where it will

presently become a reflecting mirror for the world's largest telescope. This amazing instrument will enable man to see four times further through space than he has ever been able to do before. But if you think it can see through

your Income Tax form, well, forget it ! After all, it can't be expected to

achieve the impossible. This molten glass was poured out a year ago, and only

now has it cooled sufficiently for polishing to commence. The polishing business is to

take about five years. So we will probably be looking into

space and getting down to

the question of unemployment about the same time.
