

NAVY CARRIERS.

Britain has a new invention which is expected to supersede the old method of the batman on aircraft carriers. Coming in to land, the pilot sees to the left of the carrier, a mirror-sight which diverts him into the correct position for touching down. And slow motion shows you how effective it is. This invention solves the problem of landing high-speed jets at sea.

And here at Gosport is the Navy's new arm for the destruction of enemy submarines.

Our cameraman goes aloft with the first helicopter squadron, R.N.3 As submarines dive deeper and travel faster --- it is claimed that the helicopter anti-submarine patrol will be one of the answers.
